CMake: glob_recurse with symbolic linked folders

MARKDOWN If using CMake's file glob_recurse for catching source-file and you want this to also follow symbolic-links, just add the 'FOLLOW_SYMLINKS'-keyword: Like this: `file(GLOB_RECURSE SOURCE_FILES FOLLOW_SYMLINKS src/*.cpp src/*.h)` Have look here: [cmake file-docs](<https://cmake.org/cmake/help/v3.0/command/file.html>) And a bit related. In linux to copy a folder to a new location with symlinks solved: `cp -r -L [from] [to]`
